Linguist and anthropologist Chaise LaDousa explores the visual manifestations of collegiate fun in a Midwestern college town where house signs on off-campus student residences are a focal point of college culture. With names like Boot 'N Rally, The Plantation, and Crib of the Rib, house signs reproduce consequential categories of gender, sexuality, race, and faith in a medium students say is benign. Through his analysis of house signs and what students say about them, LaDousa introduces the reader to key concepts and approaches in cultural analysis.

In this wonderfully reassuring book, readers will learn that the key to talking with children about sex is knowing that their questions fall into three easily recognizable categories. At age three or four, kids are curious about geography (Where was I before I was here?), and at four or five, about delivery (Exactly how did I get out of there?). Finally, the six year old's classic stumper--But how'd I get in there in the first place?--is about cause and effect, not about imminent sexual activity! With the emotional and developmental underpinnings of a child's curiosity understood, parents will find their tongues; with Deborah Roffman's wise, warm and practical advice, they will be well prepared for the inevitable flow of questions in the years to come.

funny anatomy names: Computational Methods in Genome Research Sándor Suhai, 2012-12-06 The application of computational methods to solve scientific and practical problems in genome research created a new interdisciplinary area that transcends boundaries traditionally separating genetics, biology, mathematics, physics, and computer science. Computers have been, of course, intensively used for many years~ in the field of life sciences, even before genome research started, to store and analyze DNA or proteins sequences, to explore and model the three-dimensional structure, the dynamics and the function of biopolymers, to compute genetic linkage or evolutionary processes etc. The rapid development of new molecular and genetic technologies, combined with ambitious goals to explore the structure and function of genomes of higher organisms, has generated, however, not only a huge and burgeoning body of data but also a new class of scientific questions. The nature and complexity of these questions will require, beyond establishing a new kind of alliance between experimental and theoretical disciplines, also the development of new generations both in computer software and hardware technologies, respectively. New theoretical procedures, combined with powerful computational facilities, will substantially extend the horizon of problems that genome research can attack with success. Many of us still feel that computational models rationalizing experimental findings in genome research fulfil their promises more slowly than desired. There also is an uncertainty concerning the real position of a 'theoretical genome research' in the network of established disciplines integrating their efforts in this field.
