human skeleton anatomy activity: 200 Science Investigations for Young Students Martin Wenham, 2000-12-13 This book enables teachers to develop a complete range of basic investigations for science with students aged five to 11 years. It demonstrates how children can use hands-on activities to consolidate and extend their knowledge and understanding. Investigations are presented in a generic form, so that teachers can work through them and adapt them to meet the particular needs of their own classes. The presentation of activities ranges from highly-structured sequences of instructions and questions (with answers!), to more general discussions, depending on the approach needed and the likely variations in equipment and materials available. Each activity is aimed to help any teacher carry out significant scientific investigations with their class, and where necessary, to learn alongside them. - Almost every investigation and activity has been tested by the author. - Investigations use readily-available, non-specialist or recycled materials. The context of this book is children's need to learn through first-hand experience of the world around them. This book is an essential resource for teachers planning an effective science programme, or for student teachers needing to broaden their scientific knowledge and understanding. 200 Science Investigations for Young Students is the companion volume of activities which demonstrate the theories in Martin Wenham's Understanding Primary Science. The content has been guided by, but not limited to, The National Curriculum 2000 and the Initial Teacher Training Curriculum for Primary Science, issued by the Teacher Training Agency.

human skeleton anatomy activity: The Archaeology of Human Bones Simon Mays, 2010-04-21 The Archaeology of Human Bones provides an up to date account of the scientific analysis of human skeletal remains from archaeological sites. This completely revised edition reflects the latest developments in scientific techniques for studying human skeletons and the latest applications of those techniques in archaeology. In particular, the sections on ancient DNA and bone stable isotopes have been comprehensively updated, and two completely new chapters have been introduced, covering metric study of the postcranial skeleton and ethical dimensions of the study of human remains. The Archaeology of Human Bones introduces students to the anatomy of bones and teeth, utilising a large number of images. It analyzes the biasing effects of decay and incomplete recovery on burial data from archaeological sites, and discusses what we may learn about burial rites from human remains. Subsequent chapters focus on demographic analysis of earlier populations, normal skeletal variation, disease and injury, isotopic and DNA analysis of bone, the study of cremated bone and ethical aspects of working with ancient human remains. Current scientific methods are explained, alongside a critical discussion of their strengths and weaknesses. The ways in which scientific analyses of human skeletal remains can contribute to tackling major archaeological or historical issues is illustrated by means of examples drawn from studies from around the world. Technical jargon is kept to a minimum, and each chapter contains a summary of the main points that a student should grasp and a list of further reading targeted to enable students to follow up major issues covered in the book. Featuring case studies from around the world and with copious illustrations, The Archaeology of Human Bones continues to be a crucial work for students of archaeology.
