ms365 business basic: Sb Organoantimony Compounds Marlies Mirbach, Markus Wieber, 2013-11-11 This fifth volume on organoantimony compounds continues the description of pentavalent antimony compounds and concludes the entire series. The treatment of pentavalent compounds with three Sb-C bonds began in Part 4 with the RSbX type and is now completed with types RSb(X)Y, RR'SbX, RR'Sb(X)Y, 3 2 3 2 2 2 RR'RSbX (Section 2.5.1) and the corresponding bi- and trinuclear compounds (Sections 2.5.2, p.87, and 2.5.3, p. 132). R, R', and R denote different organic groups bonded through carbon to the antimony atom. X and Y represent inorganic or organic groups that are bonded to antimony by an atom other than carbon. R, X, and/or Y can also be chelating ligands. The remaining part of the volume completely covers all pentavalent antimony compounds containing two Sb-C bonds (RSbX, RSb(X)Y, RR'SbX, RR'Sb(X)Y, bi- and tetranuclear 2 3 2 2 3 2 compounds, Chapter 2.6, p. 134) and those containing one Sb-C bond (RSbX, RSb(X)Y, 4 3 RSb(X)Y, bi- and trinuclear compounds, Chapter 2.7, p. 237). These compounds form adducts with Lewis bases (symbol D) and form many ionic complexes by the addition of salts such as amine hydrochlorides (symbol MZ). The adducts and ionic complexes are described immediately after the parent substances. The volume concludes with an Empirical Formula Index (p. 318) and a Ligand Formula Index (p. 357).

ms365 business basic: Modern High Temperature Science John L. Margrave, 2012-12-06 It is a great pleasure to have the opportunity to honor our distinguished colleague, Professor Leo Brewer, on the occasion of his sixty-fifth birth day, with this special volume of High Temperature Science. Leo and his wife, Rose, are personal friends of several generations of students and postdoctoral researchers at the University of California at Berkeley. Their concern and understanding has been important to many of us over the past forty years. Each paper in this volume has at least one author who was a graduate student or a postdoctoral researcher in Leo's laboratory at Berkeley. The variety of topics is indicative of the wide-ranging science done by Brewerites and by Leo Brewer himself. He has personally participated in the resolution of many of the classical problems of high-temperature science—from the heat of sublimation of graphite to the dissociation energy of nitrogen to the prediction of binary and ternary phase diagrams. He and his students have made major contributions to atomic and molecular spectroscopy. He has made significant contributions to the development of efficient systems for energy conversion and to ceramics. In addition to his research activities, Leo Brewer has been a long-time participant in the dynamic undergraduate teaching program of the Berkeley Chemistry Department. He has provided crucial insight for students involved in those career-shaping experiences that one endures while acquiring the basics of inorganic, organic, and physical chemistry with that interwoven common bond of thermodynamics.

ms365 business basic: Tribology and Mechanics of Magnetic Storage Devices Bharat Bhushan, 2012-12-06 Magnetic recording is presently a \$50 billion industry. It spans audio, video, and digital applications in the form of tapes and disks. The industry is expected to grow by a factor of five or more in the next decade. This growth will be accompanied by dramatic improvements in the technology, and the potential exists for magnetic-recording densities to improve by at least one order of magnitude! Magnetic-recording process is accomplished by relative motion between a magnetic head and a magnetic medium. Types of magnetic media for digital recording are: flexible media (tapes and floppy disks) and rigid disks. Physical contact between head and medium occurs during starts and stops and hydrodynamic air film develops at high speeds. Flying heights (mean separation between head and medium) are on the order of 0.1 micrometer comparable to surface roughness of the mating members. Need for higher and higher recording densities requires that surfaces be as smooth as possible and flying heights be as low as possible. Smoother surfaces lead to increased
