sparklight business customer service: Optical Methods in Dynamics of Fluids and Solids M. Pichal, 2012-12-06 The General Assembly of the International Union of Theoretical and Applied Mechanics decided in Cambridge, United Kingdom, in 1982 to arrange the Symposium on Optical Methods in the Dynamics of Fluids and Solids. This decision was stimulated by the fact that optical diagnostic methods are a more and more important tool in experimental mechanics. In contrast to the foregoing Symposium in Poitiers. 1976, which was devoted exclusively to optical methods in the mechanics of solids, it was a fruitful idea to bring together during the present Symposium scientists engaged in optical methods in the dynamics of all phases. It was proposed by the International Scientific Committee of the Symposium that contributions in experimental fluid dynamics should deal with transition from laminar to turbulent flow, compressible fluid flow including high temperature flow, non-equilibrium phenomena in fluid dynamics and the interaction of fluid flow with solid boundaries and bodies. As regards the mechanics of solids, the contributions should deal with the application of optical methods in the wave propagation in shock loaded bodies, in phenomena connected with the fracture mechanism, in nonstationary Vibrations of elements and parts of systems and in nonstationary strains in structures. The International Scientific Committee preferred to avoid invited lectures and in cooperation with the National Committees of IUTAM called for contribution from individual countries.

sparklight business customer service: High-Pressure Shock Compression of Solids VIII L.C. Chhabildas, Lee Davison, Y. Horie, 2006-03-30 Research in the field of shock physics and ballistic impact has always been intimately tied to progress in development of facilities for accelerating projectiles to high velocity and instrumentation for recording impact phenomena. The chapters of this book, written by leading US and European experts, cover a broad range of topics and address researchers concerned with questions of material behaviour under impulsive loading and the equations of state of matter, as well as the design of suitable instrumentation such as gas guns and high-speed diagnostics. Applications include high-speed impact dynamics, the inner composition of planets, syntheses of new materials and materials processing. Among the more technologically oriented applications treated is the testing of the flight characteristics of aeroballistic models and the assessment of impacts in the aerospace industry.

O. K. Krehl, 2008-09-24 This unique and encyclopedic reference work describes the evolution of the physics of modern shock wave and detonation from the earlier and classical percussion. The history of this complex process is first reviewed in a general survey. Subsequently, the subject is treated in more detail and the book is richly illustrated in the form of a picture gallery. This book is ideal for everyone professionally interested in shock wave phenomena.

sparklight business customer service: *Atomic Physics of Highly Ionized Atoms* Richard Marrus, 2012-12-06 The last decade has seen dramatic progress in the development of devices for producing multicharged ions. Indeed it is now possible to produce any charge state of any ion right up through 92 fully-stripped uranium (U⁺). Equally dramatic progress has been achieved in the energy range of the available ions. As an example, fully-stripped neon ions have been produced in useable quantities with kinetic energies ranging from a few eV to more than 20 GeV. Interest in the atomic physics of multicharged ions has grown apace. In the fusion program, the spectra of these ions is an important diagnostic tool. Moreover the presence of multicharged ions presents a serious energy loss mechanism in fusion devices. This fact has motivated a program to study the collision mechanisms involved. In another area, multicharged ions are present in the solar corona and the interstellar medium and knowledge of their collision properties and spectra is essential to understanding the astrophysics. Other possible applications are to x-ray lasers and heavy ion inertial fusion. On a more fundamental level, new possibilities for testing quantum electrodynamics with multicharged ions have emerged.
