ap calculus teacher: Relationships Among AP Calculus Teachers' Pedagogical Content Beliefs, Classroom Practice, and Their Students' Achievement Frederick W. Utter, 1996 This study investigated associations among teachers' pedagogical content beliefs, approaches to teaching, and their students' achievement in a high school Advanced Placement (AP) Calculus setting. The three major research questions concerned: (a) how well AP calculus teachers' pedagogical beliefs about mathematics, curriculum, and instruction aligned with a constructivist point of view, (b) how AP teachers' pedagogical content beliefs were reflected in their approaches to teaching and goals for instruction, and (c) relationships among AP teachers' pedagogical content beliefs, approaches to teaching, and their students' achievement. Teachers' pedagogical content beliefs were categorized as cognitively based (CB) or less cognitively based (LCB) using a belief questionnaire adapted from research with first-grade teachers. Telephone interviews with nine CB and eight LCB teachers served to provide additional insight into their beliefs and to gain information on how teachers approach teaching differential calculus. A researcher-designed Differentiation Test was administered to assess student achievement. Interviews with nine CB teachers and eight LCB teachers revealed: (a) CB teachers were more likely to believe the role of the teacher was that of a facilitator/guide and the role of the student was to explore. LCB teachers were more likely to believe their role as that of a knowledge base, and the role of the student was to learn from the teacher. (b) CB teachers' self-reported classroom practices were found to be more student-centered and conceptual in nature than LCB teachers. (c) CB teachers were more likely to use word problems when introducing topics, emphasize student involvement, have their students work in groups, emphasize visual approaches to topics, and consider students' knowledge when planning instruction. LCB teachers were more likely to present rules and theorems, work examples, and require students to memorize rules of differentiation. Students of CB teachers were found to have a better conceptual understanding of differential calculus than students of LCB teachers. Students of CB teachers were better able to interpret graphical information and to interpret information given in a table. No differences were found in students' ability to work with symbolic information or to use a graphing calculator in conjunction with problem solving.

There are many ways that the concept of a border illuminates the field of mathematics pre-service teacher education. Consequently, there are a multitude of responses to these borders: researchers and practitioners question, challenge, cross, blur, and erase them. Chapters include the following topics: explorations of mathematics across topics (e.g., geometry, algebra, probability) and with other disciplines (e.g., science, the arts, social sciences); challenging gender, cultural, and racial borders; exploring the structure and curriculum of teacher education programs; spaces inhabited by teacher education programs (e.g., university, community); and international collaborations and programs to promote cross-cultural sharing and learning. The book targets a readership of researchers and graduate students in integrated education studies, teacher education, practitioners of mathematics education, curriculum developers, and educational administrators and policy makers.
