edesign course outline: Toward Quality Assurance and Excellence in Higher Education Ahmed Odeh Al Jaber, 2022-09-01 Quality Assurance is not a new concept in the education sector in general, and higher education in particular, though it is becoming increasingly more relevant and important. Higher education helps to improve an individual's quality of life by enabling them to inflate their knowledge and expertise, to grasp abstract concepts and theories, and to raise their awareness of the world and their community, and as such the assurance of quality is becoming more pivotal in the whole education process. There is no simple definition of the concept of quality in education, though numerous models and theories have been devised. Toward Quality Assurance and Excellence of Higher Education is a new episode of the Quality Assurance perception in higher education, which identifies the quality culture and orientation from the beginning, integrating crucial factors to build a “pyramid” of higher education excellence. The book compares concepts from the main theories of Quality Assurance, management and control when they are applied to educational systems in higher education. The book also presents a new model of excellence in higher education. Excellence is an architecture of building blocks that comes with process performance, effectiveness, harmony and collaboration which should be incorporated in a quality-oriented concept of a sustainable excellence of higher education. The model integrates four main facets: the Educational System, Quality Assurance Managing and Control, Strategic Planning and Globalization. Also presented are international “best-practices” in quality assurance in higher education, from Japan and Finland.

edesign course outline: Educational Technology Beyond Content Brad Hokanson, Gregory Clinton, Andrew A. Tawfik, Amy Grincewicz, Matthew Schmidt, 2020-04-09 This book is the outcome of a research symposium sponsored by the Association for Educational Communications and Technology [AECT]. Consisting of twenty-four chapters, including an introduction and conclusion, it argues that informational content should not be the main element of education, and that to provide more for learners, it is necessary to go beyond content and address other skills and capabilities. It also discusses the false premise that learning is complete when the information is known, not when learners seek more: their own directions, answers, and ideas. The authors assert that the ability to synthesize, solve problems and generate ideas is not based on specific content, although education often focuses solely on teaching content. Further, they state that content can be separated from the learning process and that instructional design and educational technology must be about the skills, habits, and beliefs to be learned.

edesign course outline: Higher Education and Graduate Employment in Europe Harald Schomburg, Ulrich Teichler, 2007-01-29 From autumn 1998 to spring 2000, about 3,000 graduates each from nine countries in the European Union (Austria, Finland, France, Germany, Italy, the Netherlands, Spain, Sweden, United Kingdom), one EFTA country (Norway), one of the Central and Eastern European countries in transition (the Czech Republic) and one economically advanced country outside Europe (Japan) provided information through a written questionnaire on the relationship between higher education and employment three to four years after graduation. In total, over 40,000 graduates from higher education institutions answered questions on their socio-biographical background, study paths, transition from higher education to employment, early career, links between study and employment, job satisfaction and their retrospective view on higher education. The study provided a unique opportunity to examine how far the relationships between higher education and the world of work are similar or different in the Western European countries. This became clearer through the inclusion of one country of the Central and Eastern European countries and one country outside Europe. The study also helped to understand the common elements and differences between various fields of study and occupational areas. It made it possible to analyse current salient issues of higher education, e. g. equality, the role of educational levels, the demand for specialized or general competences, the growing role of international mobility and lifelong education, the regional diversity in higher education.
