In the EU, women over 45 receive regular radiological screening, while younger women at high-risk of developing breast cancer receiving annual surveillance. However, current radiological approaches are suboptimal suffering from high false positive and negative rate, leading to overtreatment and late detection. Locally advanced breast cancer (LABC) is diagnosed in approximately 4% of the patients in the EU to 30-60% in developing countries, and neoadjuvant chemotherapy (NACT) is increasingly used to improve surgical outcome. However, 10-20% of the patients do not respond to the treatment leading to unnecessary exposure to drug toxicity and delay in surgery, demanding imaging markers sensitive to tumour metabolism rather than crude tumour size estimation in current radiological methods.
