jordan math 8: Non-Associative Normed Algebras: Volume 1, The Vidav-Palmer and Gelfand-Naimark Theorems Miguel Cabrera García, Ángel Rodríguez Palacios, 2014-07-31 This first systematic account of the basic theory of normed algebras, without assuming associativity, includes many new and unpublished results and is sure to become a central resource for researchers and graduate students in the field. This first volume focuses on the non-associative generalizations of (associative) C^* -algebras provided by the so-called non-associative Gelfand-Naimark and Vidav-Palmer theorems, which give rise to alternative C^* -algebras and non-commutative JB^* -algebras, respectively. The relationship between non-commutative JB^* -algebras and JB^* -triples is also fully discussed. The second volume covers Zel'manov's celebrated work in Jordan theory to derive classification theorems for non-commutative JB^* -algebras and JB^* -triples, as well as other topics. The book interweaves pure algebra, geometry of normed spaces, and complex analysis, and includes a wealth of historical comments, background material, examples and exercises. The authors also provide an extensive bibliography.

jordan math 8: Local Multipliers of C^* -Algebras Pere Ara, Martin Mathieu, 2012-12-06 Many problems in operator theory lead to the consideration of operator equations, either directly or via some reformulation. More often than not, however, the underlying space is too 'small' to contain solutions of these equations and thus it has to be 'enlarged' in some way. The Berberian-Quigley enlargement of a Banach space, which allows one to convert approximate into genuine eigenvectors, serves as a classical example. In the theory of operator algebras, a C^* -algebra A that turns out to be small in this sense traditionally is enlarged to its (universal) enveloping von Neumann algebra A . This works well since von Neumann algebras are in many respects richer and, from the Banach space point of view, A is nothing other than the second dual space of A . Among the numerous fruitful applications of this principle is the well-known Kadison-Sakai theorem ensuring that every derivation δ on a C^* -algebra A becomes inner in A , though δ may not be inner in A . The transition from A to A however is not an algebraic one (and cannot be since it is well known that the property of being a von Neumann algebra cannot be described purely algebraically). Hence, if the C^* -algebra A is small in an algebraic sense, say simple, it may be inappropriate to move on to A . In such a situation, A is typically enlarged by its multiplier algebra $M(A)$.

jordan math 8: Non-Associative Normed Algebras : Volume 2, Representation Theory and the Zel'manov Approach Miguel Cabrera García, Ángel Rodríguez Palacios, 2018-04-12 This first systematic account of the basic theory of normed algebras, without assuming associativity, includes many new and unpublished results and is sure to become a central resource for researchers and graduate students in the field. This second volume revisits JB^* -triples, covers Zel'manov's celebrated work in Jordan theory, proves the unit-free variant of the Vidav-Palmer theorem, and develops the representation theory of alternative C^* -algebras and non-commutative JB^* -algebras. This completes the work begun in the first volume, which introduced these algebras and discussed the so-called non-associative Gelfand-Naimark and Vidav-Palmer theorems. This book interweaves pure algebra, geometry of normed spaces, and infinite-dimensional complex analysis. Novel proofs are presented in complete detail at a level accessible to graduate students. The book contains a wealth of historical comments, background material, examples, and an extensive bibliography.

jordan math 8: Maximal Solvable Subgroups of Finite Classical Groups Mikko Korhonen, 2024-07-26 This book studies maximal solvable subgroups of classical groups over finite fields. It provides the first modern account of Camille Jordan's classical results, and extends them, giving a classification of maximal irreducible solvable subgroups of general linear groups, symplectic groups, and orthogonal groups over arbitrary finite fields. A subgroup of a group G is said to be maximal solvable if it is maximal among the solvable subgroups of G . The history of this notion goes back to Jordan's *Traité* (1870), in which he provided a classification of maximal solvable subgroups of symmetric groups. The main difficulty is in the primitive case, which leads to the problem of classifying maximal irreducible solvable subgroups of general linear groups over a field of prime order. One purpose of this monograph is expository: to give a proof of Jordan's classification in modern terms. More generally, the aim is to generalize these results to classical groups over arbitrary finite fields, and to provide other results of interest related to irreducible solvable matrix groups. The text will be accessible to graduate students and researchers interested in primitive permutation groups, irreducible matrix groups, and related topics in group theory and representation theory. The detailed introduction will appeal to those interested in the historical background of Jordan's work.

These entries are arranged alphabetically throughout and a detailed index is included. This supplementary volume enhances the existing twelve volumes, and together, these thirteen volumes represent the most authoritative, comprehensive and up-to-date *Encyclopaedia of Mathematics* available.
