rbans form b: *Cognitive Remediation for Brain Injury and Neurological Illness* Marvin H Podd, 2011-11-04 The purpose of this book is to teach psychologists with a neuropsychology background about cognitive remediation, the evidence in the research literature, and how to develop and conduct a treatment plan and evaluate the effectiveness of the interventions. The approach is illustrated using the computer-assisted cognitive remediation program developed by the author (NeurXercise). Twenty-nine different cases are presented in depth, following the outline presented in the earlier portions of the book. Treatment planning emphasizes Luria's concepts of alternate functional systems and double dissociation. Pre- and post-treatment neuropsychological testing results are presented along with ecological validity and generalization to daily functioning. The cases are presented by etiology and each section concludes with what can be learned about that etiologic process from the cognitive remediation results. This section includes blast injuries, which are still being characterized in the literature, as well as effective treatment of patients with head injury, stroke, post-neurosurgical sequelae, co-morbid disorders, subcortical disorders, attention deficit disorder, and learning disabilities. The book identifies the most commonly used neuropsychological test instruments for evaluating cognitive deficits, discusses their input and output characteristics, and does the same for the NeurXercise computer-based exercises so that the connection between testing and treatment is easy to see and develop. In addition to discussing this in the appropriate sections of the book, these are summarized in the appendixes as a reference for correlating test findings and appropriate exercises for remediating deficits.

rbans form b: Construct Validity of the RBANS Forms A and B Erica Lopez, 2018 The Repeatable Battery for the Assessment of Neuropsychological Status (RBANS; Randolph, 1998) is a standardized assessment that was designed to measure cognitive function in older adults. The RBANS is a commonly used neuropsychological assessment with moderate support of its clinical utility. However, the RBANS was developed theoretically without the use of factor analytic studies. Previous studies evaluating the factor structure of the RBANS failed to provide significant support for Randolph's proposed five-factor structure. The purpose of this study was to evaluate the proposed five-factor structure of the RBANS Forms A and B, using a Confirmatory Factor Analysis (CFA), in a homogeneous geriatric population of 'healthy' adults. Results of the RBANS Form A suggest a three-factor solution. The first factor was defined as a Memory and Attention index, Factor two was defined as a Learning index, and Factor Three was defined as a Visuospatial Function and Language index. An additional CFA was conducted on the RBANS Forms A and B combined to determine if combining forms would yield the proposed five-factor structure. Results found the combined forms to also fit a three-factor structure. Additionally, the current study conducted a CFA on the RBANS and WAIS-IV combined to evaluate if similar subtests loaded together in the same factors (convergent validity).

rbans form b: Brain Networks in Aging: Reorganization and Modulation by Interventions Junfeng Sun, Chunbo Li, 2018-02-22 Old adults undertake multiple reduced cognitive abilities in aging, which are accompanied with specific brain reorganization in forms of regional brain activity and brain tissues, inter-region connectivity, and topology of whole brain networks in both function and structure. The plasticity changes of brain activities in old adults are explained by the mechanisms of compensation and dedifferentiation. For example, older adults have been observed to have greater, usually bilateral, prefrontal activities during memory tasks compared to the typical unilateral prefrontal activities in younger adults, which was explained as a compensation for the reduced brain activities in visual processing cortices. Dedifferentiation is another mechanism to explain that old adults are with much less selective and less distinct activity in task-relevant brain regions compared with younger adults. A larger number of studies have examined the plasticity changes of brain from the perspective of regional brain activities. However, studies on only regional brain activities cannot fully elucidate the neural mechanisms of reduced cognitive abilities in aging, as multiple regions are integrated together to achieve advanced cognitive function in human brain. In recent years, brain connectivity/network, which targets how brain regions are integrated, have drawn increasing attention in neuroscience with the development of neuroimaging techniques and graph theoretical analysis. Connectivity quantifies functional association or neural fibers between two regions that may be spatially far separated, and graph theoretical analysis of brain network examines the complex interactions among multiple regions from the perspective of topology. Studies showed that compared to younger adults, older adults had altered strength of task-relevant functional connectivity between specific brain regions in cognitive tasks, and the alternation of connectivity are correlated to behavior performance. For example, older adults had weaker functional connectivity between the premotor cortex and a region in the left dorsolateral prefrontal cortex in a working memory task. Interventions like cognitive training and neuro-modulation (e.g., transcranial magnetic stimulation) have been shown to be promising in regaining or retaining the decreasing cognitive abilities in aging. However, only few neuroimaging studies have examined the influence of interventions to old adult's brain activity, connectivity, and cognitive performance. This Research Topic calls for contributions on brain network of subjects in normal aging or with age-related diseases like mild cognitive impairment and Alzheimer's disease. The studies are expected to be based on neuroimaging techniques including but not limited to functional magnetic resonance imaging, Electroencephalography, and diffusion tensor imaging, and contributions on the

influence of interventions to brain networks in aging are highly encouraged. All these studies would enrich our understanding of neural mechanisms underlying aging, and offer new insights for developing possible interventions to retain cognitive abilities in aging subjects.

Black, 2011-07-15 Alzheimer's disease is a common problem that is becoming progressively more prevalent and burdensome to the world. Through better recognition of this disease and more precise diagnosis, led by brain imaging in the appropriate clinical context, it is our sincere hope that mankind can conquer this terrible disease. This handbook was developed to provide an overview of the state of the art of brain-imaging approaches that have recently emerged to reveal the critical characteristics of brains of patients with Alzheimer's disease. It provides numerous chapters that examine this critical phase of Alzheimer's disease, as well as chapters that discuss diagnosis, early biomarkers, late changes, the role of vascular disease, treatment, progression of the disease, determining the variability of the manifestation of Alzheimer's disease, and estimating the utility of these metrics of disease severity for examining the effects of treatments. Each of 10 sections addresses a particular neuroimaging modality that has been found to be useful in understanding or diagnosing Alzheimer's disease. Each section features an introduction to the particular technique and its potential for informing clinical care or evaluating novel therapies for Alzheimer's patients. Chapters in each section provide clinicians with specific information as to how the particular neuroimaging technique is or can be useful in a clinical setting, from radiology to primary care, and address specific advances in the various types of neuroimaging. The book includes brief overviews of imaging of Alzheimer's disease and reviews fundamental principles for neuroimaging pathological changes that it causes, with an emphasis on practical and future applications.
