totally science new links: *The New Science of Cities* Michael Batty, 2017-07-28 A proposal for a new way to understand cities and their design not as artifacts but as systems composed of flows and networks. In *The New Science of Cities*, Michael Batty suggests that to understand cities we must view them not simply as places in space but as systems of networks and flows. To understand space, he argues, we must understand flows, and to understand flows, we must understand networks—the relations between objects that compose the system of the city. Drawing on the complexity sciences, social physics, urban economics, transportation theory, regional science, and urban geography, and building on his own previous work, Batty introduces theories and methods that reveal the deep structure of how cities function. Batty presents the foundations of a new science of cities, defining flows and their networks and introducing tools that can be applied to understanding different aspects of city structure. He examines the size of cities, their internal order, the transport routes that define them, and the locations that fix these networks. He introduces methods of simulation that range from simple stochastic models to bottom-up evolutionary models to aggregate land-use transportation models. Then, using largely the same tools, he presents design and decision-making models that predict interactions and flows in future cities. These networks emphasize a notion with relevance for future research and planning: that design of cities is collective action.

totally science new links: Science and Ideology in the Policy Sciences Paul Diesing, 2017-07-05 The purpose of this book is to examine how ideology operates--in the sense of influencing the conduct of inquiry--in the policy sciences, defined as economics, political science, and sociology. The author seeks to identify the main ideologies and show how each ideology produces a preference for certain problems, methods, and hypotheses; how it sensitizes scientists to certain phenomena and suggests certain interpretations of those phenomena; and how it closes off other phenomena and concepts from investigation and testing, or at least distorts that investigation. In this book, Diesing critically examines all the major schools of policy-related social thought from 1930 to 1975. He deals with Neoclassical Economics and its various applications, the Keynesians, the Systems Approach, the Schumpeter perspective, the Critical Intellectuals, the Pluralists, the J. K. Galbraith School, New Left Marxism, and the Ecological Paradigm of Schumacher and others. The world looks different if your perspective is that of a rational small businessman working in a society of hypothetical perfect competition, as opposed to that of a proletarian, looking up at your oppressors. Part One is descriptive and evaluative, considering each ideology in turn; Part Two considers the policy implications. In 1982, Diesing published a remarkable book entitled Science and Ideology in the Policy Sciences. When I interviewed Diesing in Buffalo in the summer of 1984, he told me that to date, the publication had been reviewed in only two professional journals. I was astounded. Science & Ideology...was the best book I had read in a decade, and it related directly to all the policy sciences. The lack of professional response may partially reflect Diesing's disinterest in self-promotion, but beyond this is the 'community' problem. Scholars are recognized within disciplines, but there is only a tiny 'community of social science'. I consider this to be the most brilliant of Diesing's books. Like all of Diesing's works, it remains highly relevant today.--from the introduction by Richard Hartwig.

The literature on categorization reveals there is a plethora of definitions, theories, models and methods to apprehend this central object of study. The contributions in this handbook reflect this diversity. For example, the notion of category is not uniform across these contributions, and there are multiple definitions of the notion of concept. Furthermore, the study of category and categorization is approached differently within each discipline. For some authors, the categories themselves constitute the object of study, whereas for others, it is the process of categorization, and for others still, it is the technical manipulation of large chunks of information. Finally, yet another contrast has to do with the biological versus artificial nature of agents or categorizers. - Defines notions of category and categorization - Discusses the nature of categories: discrete, vague, or other - Explores the modality effects on categories - Bridges the category divide - calling attention to the bridges that have already been built, and avenues for further cross-fertilization between disciplines
