Drawing on a range of game case studies and disciplinary perspectives, the contributors consider the sonic environment in games as its own storytelling medium. Highlighting how dynamic video game soundscapes respond to players' movements, engage them in collaborative composition, and actively contribute to worldbuilding, the chapters discuss topics including genre conventions around soundscape design, how sonic environments shape players' perceptions, how game sound and music model ecological processes and nonhuman relationships, and issues of cultural and geographic representation. Together, the essays in this volume bring game music and sound into the environmental humanities and transform our understanding of sonic environments as an essential part of storytelling in interactive media. Engaging a wide variety of game genres and communities of play, this book will be of interest to students and scholars of music, media studies, critical game studies, popular culture, and sound studies.

Combining algorithmic knowledge and game-related problems, it explores the most common problems encountered in game programming. The first part of the book presents practical algorithms for solving “classical” topics, such as random numbers, procedural generation, tournaments, group formations and game trees. The authors also focus on how to find a path in, create the terrain of, and make decisions in the game world.
