math textbooks year 10: *Modern Mathematics* Dirk De Bock, 2023-03-08 The international New Math developments between about 1950 through 1980, are regarded by many mathematics educators and education historians as the most historically important development in curricula of the twentieth century. It attracted the attention of local and international politicians, of teachers, and of parents, and influenced the teaching and learning of mathematics at all levels—kindergarten to college graduate—in many nations. After garnering much initial support it began to attract criticism. But, as Bill Jacob and the late Jerry Becker show in Chapter 17, some of the effects became entrenched. This volume, edited by Professor Dirk De Bock, of Belgium, provides an outstanding overview of the New Math/modern mathematics movement. Chapter authors provide exceptionally high-quality analyses of the rise of the movement, and of subsequent developments, within a range of nations. The first few chapters show how the initial leadership came from mathematicians in European nations and in the United States of America. The background leaders in Europe were Caleb Gattegno and members of a mysterious group of mainly French pure mathematicians, who since the 1930s had published under the name of (a fictitious) “Nicolas Bourbaki.” In the United States, there emerged, during the 1950s various attempts to improve U.S. mathematics curricula and teaching, especially in secondary schools and colleges. This side of the story climaxed in 1957 when the Soviet Union succeeded in launching “Sputnik,” the first satellite. Undoubtedly, this is a landmark publication in education. The foreword was written by Professor Bob Moon, one of a few other scholars to have written on the New Math from an international perspective. The final “epilogue” chapter, by Professor Geert Vanpaemel, a historian, draws together the overall thrust of the volume, and makes links with the general history of curriculum development, especially in science education, including recent globalization trends.

math textbooks year 10: *Multimodality in Writing* Arlene Archer, Esther Breuer, 2015-06-29 *Multimodality in Writing* attempts to generate and apply new theories, disciplines and methods to account for semiotic processes in texts and during text production. It thus showcases new directions in multimodal research and theorizing writing practices from a multimodal perspective. It explores texts, producers of texts, and readers of texts. It also focuses on teaching multimodal text production and writing pedagogy from different domains and disciplines, such as rhetoric and writing composition, architecture, mathematics, film-making, science and the newsroom. *Multimodality in Writing* explores the kinds of methodological approaches that can augment social semiotic approaches to analyzing and teaching writing, including rhetoric, Systemic Functional Linguistics, ethnographic approaches, and genre pedagogy. Much of the research shows how the regularities of modes and interest of sign makers are socially shaped to realize convention. Because of this, the approaches are strongly underpinned by social and cultural theories of representation and communication.

Francis J. Lopez-Real, 2006-08-02 The idea of the ICMI Study 13 is outlined as follows: Education in any social environment is influenced in many ways by the traditions of these environments. This study brings together leading experts to research and report on mathematics education in a global context. Mathematics education faces a split phenomenon of difference and correspondence. A study attempting a comparison between mathematics education in different traditions will be helpful to understanding this phenomenon.
