zearn workbooks: Learning Mathematics Successfully Clark J Hickman, Helene J. Sherman, 2019-09-01 The goal of this book is to bring together the concept of self-efficacy theory with practical how-to strategies for both teachers and parents to use in heightening their students' levels of self-efficacy. The book examines how self-efficacy theory relates to the acquisition of mathematical competence. The text also provides specific and practical how-to strategies for both teachers and parents in applying these principles to classroom mathematics instruction and activities. The self-efficacy practices and applications to mathematics are also suitable for families working with learners outside the school environment. Acquiring mathematical skills requires more than knowing arithmetic tables, memorizing rules, and knowing proofs. It requires a basic belief that one is capable of obtaining this information, making sense of it, and applying and generalizing it in mathematical problems. In addition, a student must believe that obtaining these skills leads to a positive outcome, whether it is perceived to be a good or passing grade, comfort-level in tackling mathematical problems, being able to advance to the next mathematics course, being able to score highly on the math section of the SAT and/or be competitive for a desired job. The ability of students to achieve and exceed grade level competence in mathematics is addressed through the lens of Albert Bandura's Self-Efficacy Theory. This theoretical position states that one will persist in mastering a behavior (in this case, mastering mathematical principles and skills), in the face of obstacles or failures—to the extent that one believes he or she has the ability to do so, and that there is a desired outcome for doing so. The research literature on the role of self-efficacy in mathematic instruction is examined to demonstrate the validity of using this concept to increase student (and parent/teacher) confidence in learning and applying grade-appropriate math content. Specific teaching methodologies will be provided that infuse self-efficacy strategies for students. Lastly, teachers and parents are provided strategies to increase their own self-efficacy when it comes to conveying mathematics principles to their child or student, as well as strategies to assess their students' level of self-efficacy over time. Teaching and learning mathematics so that students achieve success at their grade level or above can present a variety of challenges. One barrier that affects learners is the belief that one is not capable of learning mathematics or not naturally talented in the field, not a "math person." As a result, learners may not believe they are capable of a positive outcome for achieving mathematics success. This book is an important resource for pre-service and in-service teachers, as well as families in applying the theory of self-efficacy to support learners in becoming confident and assured in their ability to understand and apply mathematical principles and

procedures. Coupled with classroom ready mathematics instructional strategies, the book provides readers with the background, tools and strategies needed to carry content success and confidence forward to remain persistent in solving all future mathematical problems.

zearn workbooks: Families, COVID, and Unequal Schooling in the US Shelley Goldman, Brigid Barron, Elizabeth B. Kozleski, Antero Garcia, 2025-07-18 This book explores how parents became education partners in new and unexpected ways during the COVID pandemic. Emerging from a range of research studies, it reframes how researchers, educators, school leaders, and policymakers can establish and foster more equitable partnerships with families. The authors ultimately argue that COVID schooling erased boundaries between schools and families as families translated, decoded, and reshaped learning in their living rooms alongside their children. Chapters use firsthand accounts by parents and caretakers to contextualize and report on how families managed their lives and the education of their children during the pandemic, before exploring the tensions and issues that arose for families which were pandemic caused or the results of educational disparities and inequalities being intensified by the COVID crisis. It thus reveals how caregivers struggled with employment and food insecurities as well as issues such as technology access and their children's learning needs. Building connections between research and practice, it re-imagines how families can be education partners, discussing how schools can carry families' assets into their work on improving schools during the pandemic, times of crisis, and into the post-pandemic future. It will appeal to researchers and graduates with interests in educational leadership, teacher education, sociology of education, and the sociology of family and parenting, with additional relevance for teachers and school administrators with interests in education in crises, school reform, and educational leadership.
